

Project name: Fuel Cell Monitor
Team members: Rana Kortam
Jessica Odutola
Sameer Osama
Russell Wells
Sponsor: John Lusher

 Problem statement: A single fuel cell is an easy power source to monitor, but to achieve any level of real usable power they must be connected in a stack. The goal of this project is to design a monitor that displays individual cell voltages and warns the user of cell abnormalities as well as which cell requires maintenance or attention

### Diagram of subsystems and interface

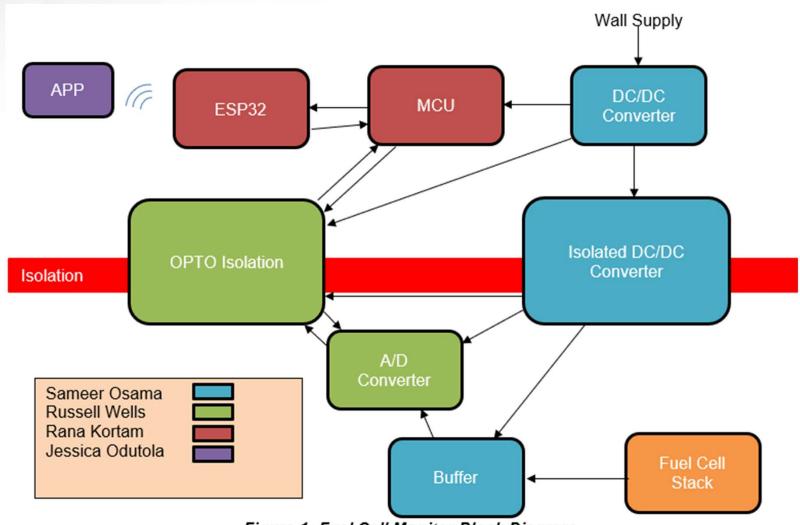

Figure 1: Fuel Cell Monitor Block Diagram

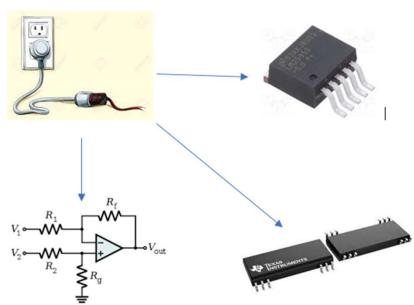

#### Task partition

- Sameer: Providing power to the system and the chips.
- Russell: Design internal, raw data manipulation prior to microprocessor.
- Rana: Design a microcontroller that will use Wi-Fi that will communicate with the android app.
- Jessica: Develop mobile android application to display voltage levels of the fuel cells.
   Application shall also alert users when errors occur with fuel cells.

### **Power Subsystem**

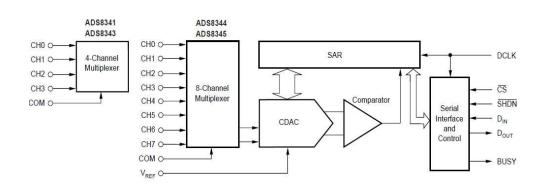

- Provide power to system
  - Using wall wart, DC/DC converter and isolated DC/DC converter
- Designing a differential amplifier
  - Filter the signals from fuel cells

#### Internal Signal Transfer and Manipulation Subsystem

- Convert analog signal to microprocessor compatible digital signal.
- Transfer digital signal to microprocessor via Opto-Isolator.

ANOUE: ACSL-6400 - Quad-Ch, All-in-One

ANOUE: 1

CATHOUE: VD2

ANOUE: VD2

ACSL-6400

### Microcontroller Subsystem

- PIC32 Microcontroller
  - Receives voltage signal from the OPTO isolation system
  - The MCU will connect to the ESP-32 microcontroller through a UART port. This allow to transfer the signal from the MCU to the ESP-32 microcontroller to send the signal to the application.

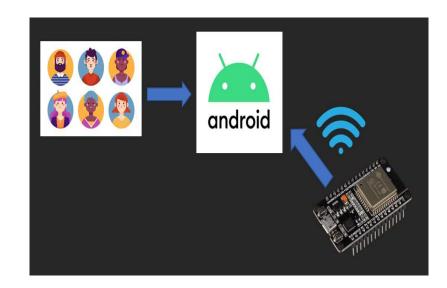

- ESP32
  - Communicate with the application via WIFI

### **Android Application Subsystem**

- Provide GUI to user's android device
- Communicates with the Microcontroller via Wi-Fi
- Provides alerts via notification system to inform users of errors with fuel cells

# **Execution plan**

## Validation plan

| Test Name                                   | Success Criteria   | Methodology   | Status   | Responsible Engineer(s) |  |
|---|--|---|----------|-------------------------|--|
| Power Devices On PCB                        | PCB transfers power without overheating or burnout   | Power Board and watch, smell, listen  | Untested | Russell, Sameer         |  |
| Internal signal voltage range               | System can properly handle the specified voltages with minimal difference between tests.                               | Introduce voltages of 0-5V and measure output signals                           | Untested | Russell                 |  |
| Differential voltage tests                  | Pass a differential voltage through the Opamp<br>buffer and receive the proper digital signal from<br>the optoisolator | Introduce a range of voltages including edge cases and ensure proper output     | Untested | Russell, Sameer         |  |
| Android application graphical functionality | Application can properly display accurate voltage levels to user.  | Use application on android device and verify volatages are accurately displayed | Untested | Jessica                 |  |
| Android Application alarm functionality     | Application send alarm to user when voltage goes above or below ranges   | Add set points to app and introduce alarm level voltages                        | Untested | Jessica                 |  |
| Power system functionality test             | Power is applied from wall outlet and proper power transfer is read at outputs   | Apply power to system and read voltage output at device trace                   | Untested | Sameer                  |  |
| Opamp system functionality test             | Differential voltages are passed to the opamp and expected voltage is seen on the output                               | Power opamps and apply varrying differential voltages and read output voltage   | Untested | Sameer                  |  |
| PIC32 Microcontroller functionality test    | The code for recieving the voltage signal for data aquisation  | PCB board and coding on IDE   | Untested | Rana                    |  |
| ESP32 Microcontroller functionality test    | The code for communicating with the application  | PCB board and coding on IDE   | Untested | Rana                    |  |
